## Google chrome setup for windows 8

Trending PS5 to renew Xbox Series X to renew Galaxy S21 Best TV Best Laptops Tom's Guide supports its audience. When you purchase through links to our website, we can earn affiliate commission. Learn more See more chrome 69, which marks your browser's 10th anniversary, is a huge release. Slick new design has the most visible changes, but there are more new features. For example, you can now personalize the Chrome New Tab page with background images and custom shortcuts. New Material theme You'll know that you're using the new Chrome browser, because you'll see a new theme after you install updates. Things mostly work the same way, although there is a new profile icon in the menu bar. You can click it to see information about the Google Account you're signed in to chrome, see your saved passwords, and manage your autofill payment methods and addresses. In Windows 10, you can make chrome's grey tab bar more colorful by enabling colored title bars if you want. If you don't like the new design at all, there's a hidden flag that will re-enable Chrome's old design. Google will probably remove this option eventually, but it will allow you to continue to use this familiar design for a while longer. RELATED: Making Chrome Look Normal Again With This Hidden Option Colorful Backgrounds on the New Tab Page New Tab Page now allows you to select any background image you like without installing the browser extension first. To set a custom background, click the gear icon in the lower-right corner of the new tab page. Select Chrome backgrounds to choose one of Google's backgrounds, or click Upload image to insert any background image that you like there. Custom shortcuts on the Chrome Tab page in Chrome on the New Tab above under search box were the most visited section that shows the webpages you visit most often. It's now gone. Instead, a new tab page lets you choose which shortcuts appear below the search box. You can click the Add Shortcut button to add shortcuts to your favorite sites. You can also rename or remove any of the existing shortcuts. Just hover over any of them and click the menu button that appears in the upper-right corner of the icon to access the options. This feature could use a little more work like we want us to drag and drop these shortcut icons to rearrange them, but customizing is nice. Password Generator and Autofill Improvements for Chrome has been a password driver for a long time, but it just got a lot better. Chrome can now automatically generate and save random passwords. Just right-click the password field and select Generate password. This feature was previously available but hidden. We recommend password managers to everyone, but most people are probably not going to install manager, such as LastPass. Chrome is better shot so that password managers can get on the masses, making it easier for everyone everywhere to use strong, unique passwords. Google Google also improved Chrome's autofill feature. The browser should be better to fill in passwords along with credit card numbers and addresses. RELATED: Chrome 69 Creates Strong Passwords For New Online Accounts omnibox Powers Up Chrome address bar, which Google calls Omnibox, just got more powerful. Many responses to search queries now immediately appear in the Omnibox as you start typing, just as they do when searching the Google home page. For example, the omnibox can record the weather to see the weather immediately there in the box. Other types of answers, such as translations of foreign words, information about sporting events and information about celebrities, must also appear here. Google promises Omnibox will search your Google Drive files soon, too. Omnibox also now makes it easy to switch between tabs. For example, if you have gmail open and type gmail in omnibox, Google will advise you to switch to the open Gmail tab instead of opening a new one. It's a great tool for anyone who likes keyboard navigation or just has too many tabs open. Easy Access to Search Mobile Chrome apps for Android, iPhone and iPad also just got an update with a new theme and layout. The navigation bar now appears at the bottom of the screen, which makes it easier to use one hand even when phones get bigger and taller. In the middle of this lower navigation bar, a new search button is also available to make it easier to start new searches, especially one-handed one-handed. Secure indicator has passed This is a small change you might not notice, but Chrome just dropped the green lock icon and Secure indicator from HTTPS sites. You'll still see a gray lock icon in the all-in-one box on secure sites, but that's it. This follows another change recently, Chrome marks all standard HTTP websites as Unsafe. Websites are secure by default unless Google Chrome says otherwise. In the future, Google is even going to get rid of this little gray lock icon. Related: Chrome 69 No Longer Says Websites Are Secure (Even If They Are) Easter Egg Chrome Dinosaur Game gets a temporary visual upgrade, too. This is an Easter egg, and it seems when you don't have an internet connection. On the No Internet page that contains the dinosaur icon, press spacebar (or tap mobile) to start the game. You play a dinosaur running through the desert and you have to jump over your c notc. It's not going to win any prizes, but it's something to do while you're waiting for the internet to come back up. In September 2018, this game now features a birthday cake that a dinosaur can eat, which gives it a party hat. There are also balloons in the background. It's like an Easter egg inside an Easter egg. Bonus: Chrome's Been Built-in Adblocker Since February, while Chrome 69 offers significant visual changes, Google updates Chrome every six weeks with new features, security updates, and bug fixes, version of the version Chrome has had some great changes, too. The most important thing you should know is Chrome's built-in adblocker. Chrome now automatically blocks ads on sites that use unpleasant ads, such as automatic video playback with audio and huge banners that block your screen. It provides a better browsing experience if you use Chrome, and it gives websites a strong incentive to show better ads to everyone. It is automatically enabled and you don't have to do anything or even think about it. These changes returned on February 15, 2018, but are easy to miss. It just quietly makes the internet better. With greater concern about privacy and security, it's nice to be able to clear your songs when you're done browsing. Chrome lets you clear the private data you choose by doing a few things. If you don't want a record to be saved to your PC, you can delete some or all of your browsing history. Here's how: Open Chrome: In the upper-right corner, select the More icon. Choose History, then select History from the menu that appears. On the Search History screen, go to the left pane and choose Clear Browsing Data. Select the Browsing history check box. You can deselect cache and cookies if you want to save this data. Select the Time Range drop-down menu and choose how much history you want to delete. To delete everything, select All time. Select Clear data. You can select other types of data on this screen. In addition to browsing history, the Basic tab includes cookies and other site data, as well as cached images and files. On the Advanced tab, you can select Download History, Passwords, AutoFill form data, and other less common choices. If you don't want to clear your entire browsing history, you can remove one site or selected site group from your browsing history. To do this, go to the More menu in Chrome and select History &gt; History. Select the check box for each site you want to clear, and then choose Delete at the top of the screen. Before you clear each browsing or data category, you're sure what each browsing or data category contains, or you can delete important information. Review each item before clearing the data: Browsing history: Your browsing history keeps track of the websites you visit. You can see this entry by selecting History or History in the upper-right corner &gt; Chrome more with three vertically aligned dots. Download history: Chrome records a record of each file you download using your browser. Cached images and files: Chrome uses its cache to store images, pages, and URLs of recently visited webpages. Using The browser can load these pages faster in future visits to the site by loading images locally from the cache rather than from the web server. Cookies and other site data: A cookie is a text file that is placed on your computer when you visit certain websites. Each cookie cookie web server when you return to your web page. Cookies remember certain settings that you have on the website. Passwords: When you enter a password on a webpage, such as email logon, Chrome usually asks if you want it to remember your password. If you choose to save your password, it is saved in the browser and then filled in the next time you visit the webpage. Autofill form data: Each time you enter information on a form on a site, Chrome can save some of that data. For example, when you fill out your name on a form, after you enter the first or two letters, the field is filled in with the entire word. This is because Chrome saved your name from a record in the previous form. While this may be convenient, it can also be a privacy concern. Thanks for letting us know! Tell us why! Why!
